

PYTHON (FOR KIDS)

Aman Giuliani, Software Developer @ Google

Recap

- Basics of Programming & Setup
- Python Data Types
 - String
 - Numbers
 - Lists

MOOOOREE.. DATA TYPES

Boolean and Dict

BOOLEAN

- Data type which only has two values True or False
- Used to comparison
- Lets try these

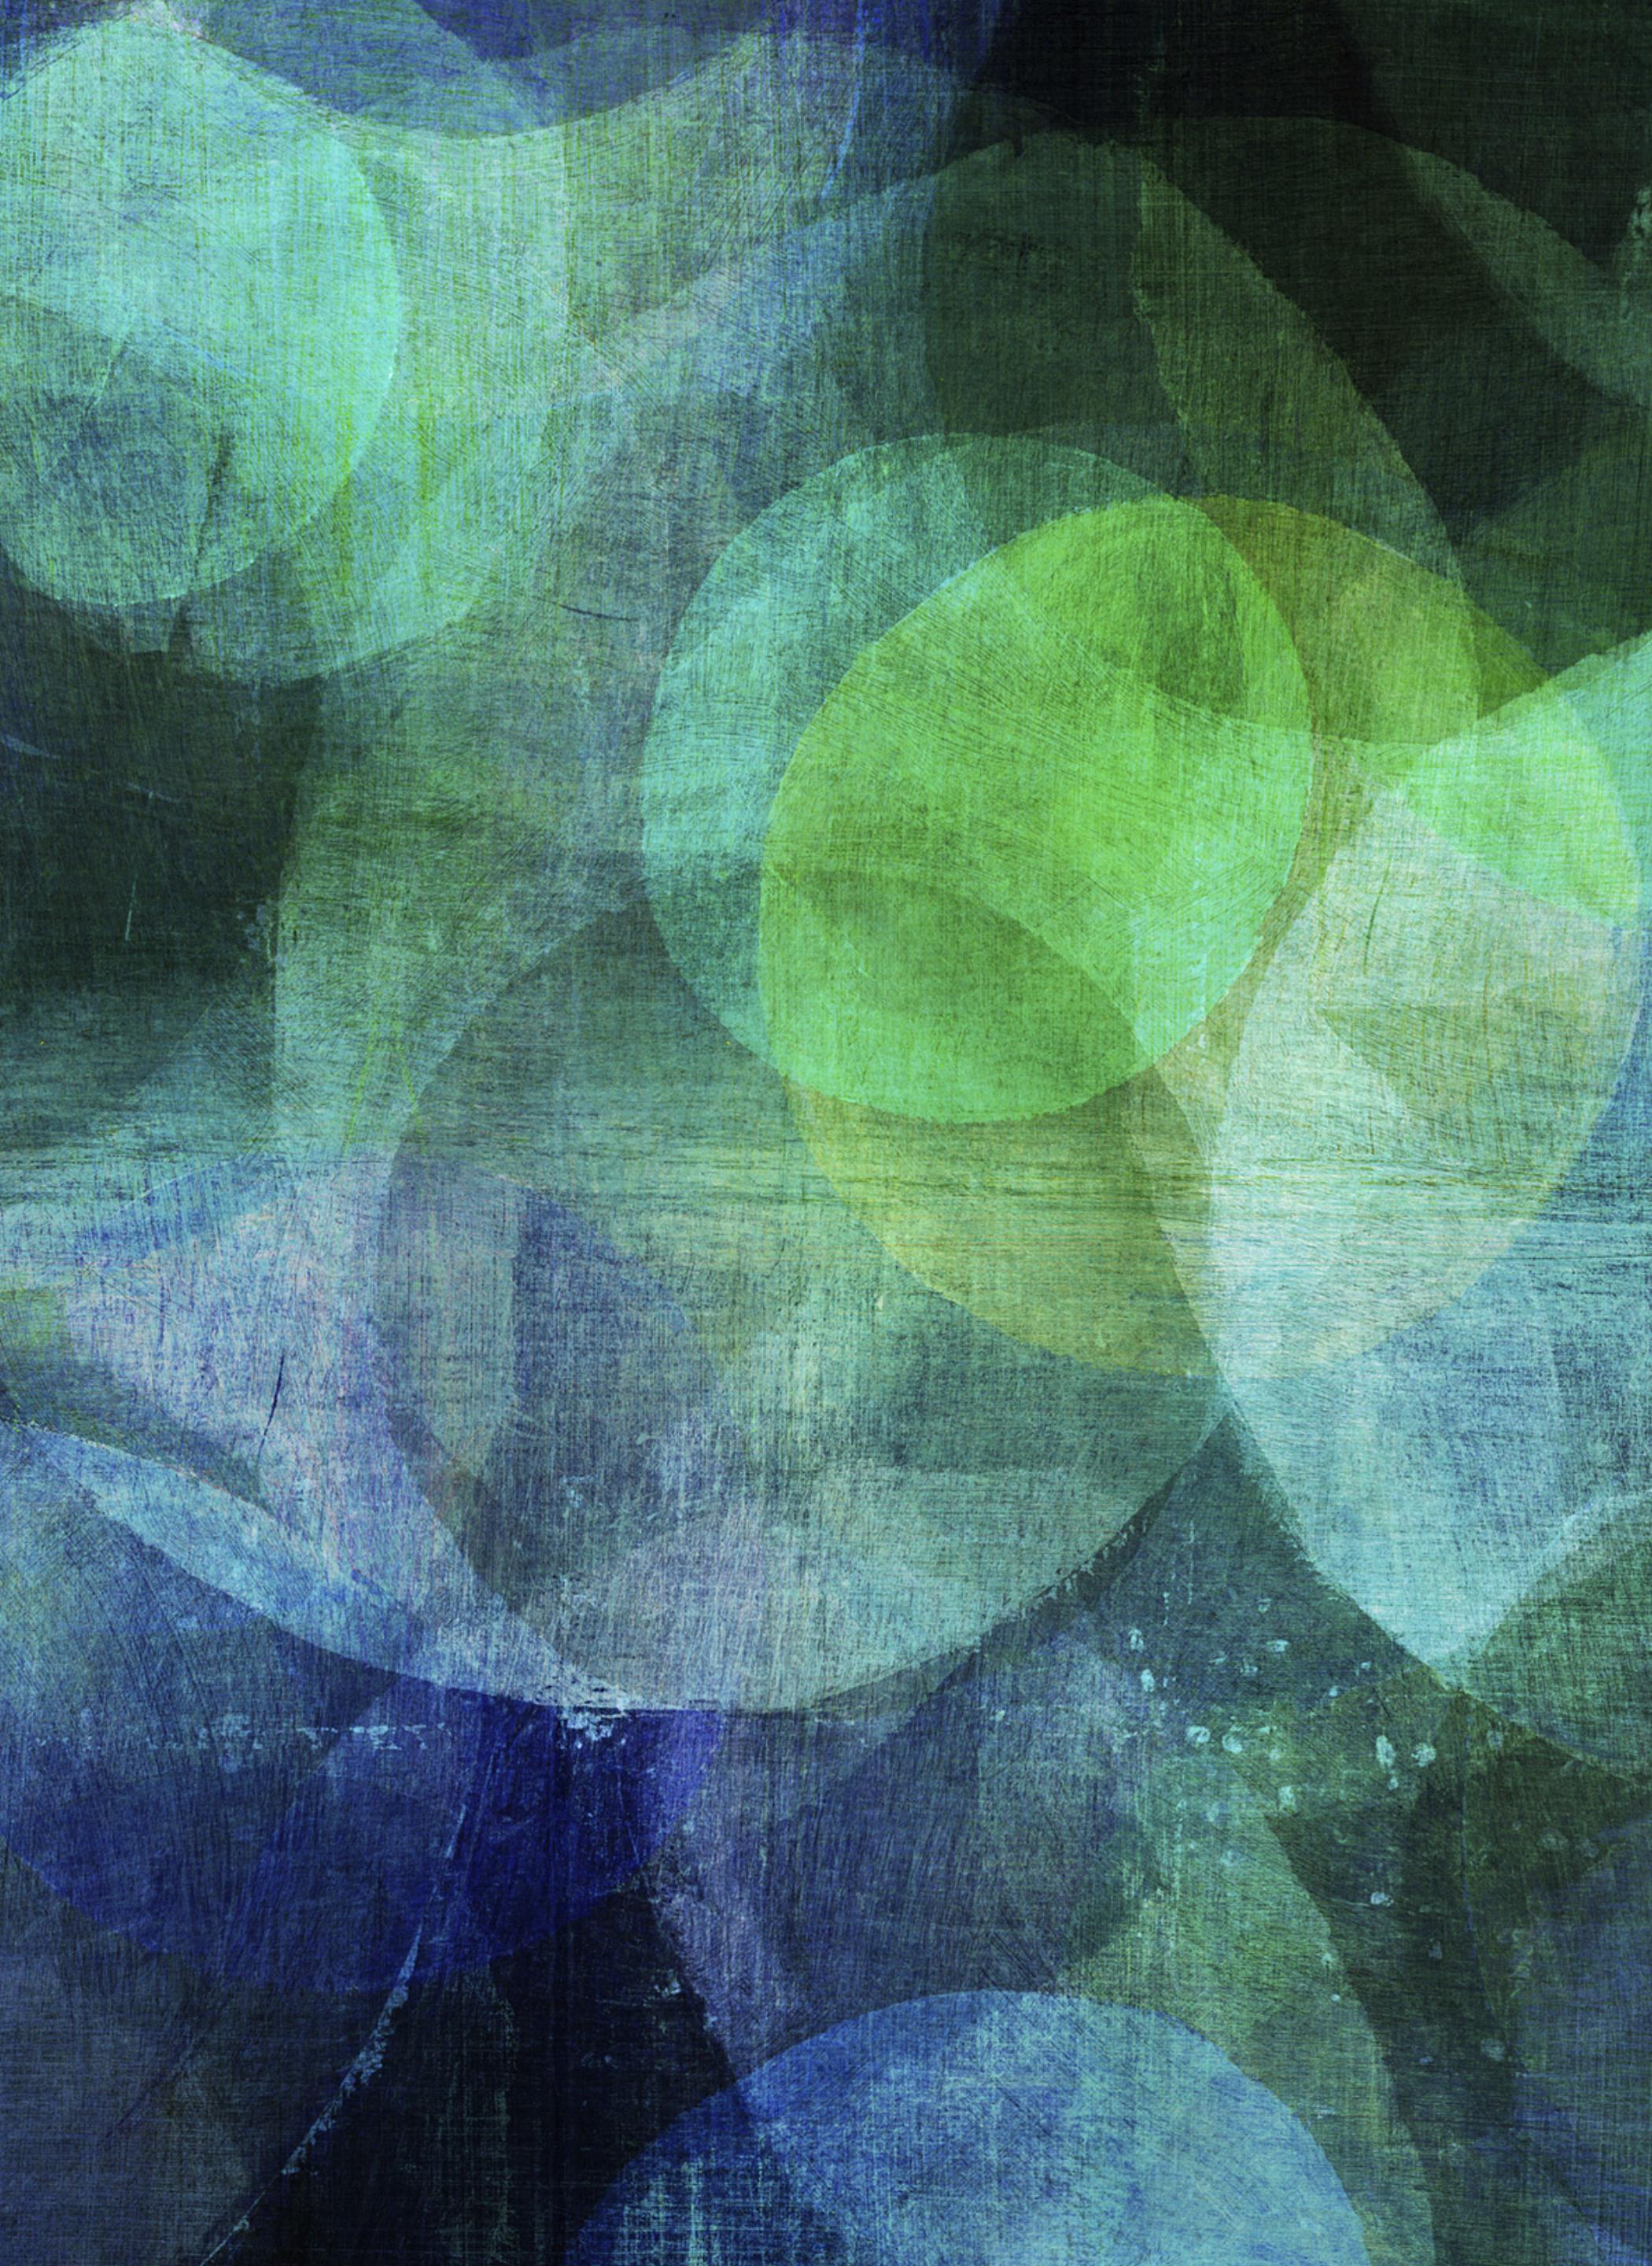

x = 2

print(x == 2) # prints out True

print(x == 3) # prints out False

print(x < 3) # prints out True

CONTROL STATEMENT

IF - ELSE

- Condition to do something based on boolean condition.
- Its something like

if statement is True:

do something

elif another_statement is True: # else if

do something else

else:

do another thing

- Lets try this

LOOPS

- For and while
- For something in List: keep doing something
- While (condition is True) : keep doing something
